Stereotactic Breast Biopsy Phantom

GAMMEX 164A

The phantom provides a good representation of breast tissue, thereby making it a close approximation to real-life learning experience.

The automated stereotactic breast biopsy procedure depends on several variables for accurate needle placement. Use of the Gammex 164A provides a valuable training tool for physicians and technicians involved in performing stereotactic procedures.

The phantom is made of a clear gel encased in a soft vinyl for easy compression and skin-like resistance to needle insertion. Embedded within the gel are 20 to 25 radiopaque lesions ranging in size from 2 to 5 mm. There are 5 mm metal lesions used for practicing core

biopsies and the 2 mm liquid lesions allow for the practice of fine needle aspiration and test the accuracy of the biopsy system and the operator.

SPECIFICATIONS

Construction Gel with attenuation properties similar to breast tissue.

Outer casing Vinyl

Radiopaque

Lesions 2 mm to 5 mm

Solid Gel or core biopsy

Liquid dye or fine needle aspiration

Compressible metal lesions instrument
